

3.1.3 Articles Module

Articles Module is our new very powerful module that can pull unlimited number of articles from various article directories based on keywords. After processing those articles on one or another way it sends them to Archiver Module for static pages generation based on set of changeable templates or WordPress Module for blog posts.

Articles Module stays above many other standalone similar software. Here are some features:

- Based on provided keywords searches the following directories with millions of articles: *ezinearticles.com, prweb.com, articlefeeder.com, findarticles.com, selfgrowth.com* (more directories will be added later).
- You can refine your search by *Title, Body or Author* of the articles.
- A "test" button to quickly see how many articles your particular keyword pulls.
- You can set any number of articles to pull with each processing, for example: 10 or 1000. You can even set a random interval of articles, for example from 15 to 50, to avoid footprints.
- You can specify the number of paragraphs in each article: - keep all paragraphs or, let say, keep random number of paragraphs up to 5.
- You can specify html tags to be removed from articles or leave all of them intact.
- You can shuffle paragraphs within each article or even **shuffle paragraphs among all pulled related articles, thus creating totally unique content!** This is a very powerful feature that will never get you delisted for duplicate content!
- This feature can randomize your content even more! You can add a random phrase at the beginning or at the end of each article. Easy upload of your phrases file.
- You can highlight your keywords in text by making them **bold**, *italic* or underlined.
- You can convert your keywords to any url of your choice and specify how many keywords to convert. Very helpful for providing one way backlinks to your other websites.
- You can leave or remove author's information with a simple click.
- By choosing Archiver Module as an output module you can make S.G.W. generate static, highly optimized crosslinked pages with your formatted articles in any way you want: all articles on one page or one article per page.
- By choosing WordPress Module as an output module you can have articles to be posted to your blog. You can even choose specific category and specific author or just set it to random category and random author.
- **High Level Of Customization and Uniqueness**
